1   Implementation Summary

This report presents a Histogram of Oriented Gradients (HOG) based face detection system implementation. The system uses template matching with HOG features to detect faces in target images.

| HOG Feature Extraction	Face Recognition Pipeline
• Gradient computation using differential filters • 6-bin orientation histograms in 8×8 pixel cells • L2 normalization of 2×2 cell blocks	• Sliding window template matching • Normalized Cross Correlation (NCC) for similarity measurement • NCC threshold: **0.48** (experimentally determined) • Non-Maximum Suppression (IoU threshold: 0.5)

2   Results
